

REMARKS

The office action dated May 13, 2008 (the "Office Action") has been received and carefully noted. Claims 1, 3-20 and 26 were examined. Claims 1, 3-18 and 26 were rejected. Applicant notes with appreciation that claims 19 and 20 are objected to as allowable if rewritten in independent form. Applicant amends claims 1, 3-5, 7, 10, 18, and 20 to cure antecedent basis or incorrect dependency issues. Applicant amends claim 11 and asserts that no new matter is added therein as amendment to claim 11 is supported at least by claim 1 and FIGs 1-5 of the application. Applicant submits additional claims 27-28 and submits that no new matter is added therein as those claims are supported at least by page 6 lines 7-13. Applicant submits additional claim 29 and submits that no new matter is added therein as additional claim 29 is supported at least by claim 20. Applicant submits additional claim 30 and submits that no new matter is added therein as additional claim 30 is supported at least by claim 19.

Hence, Applicant respectfully requests reconsideration of claims 1, 3-20 and 26; and consideration of additional claims 27-30 in view of at least the following remarks.

I. Claim Objections

Claim 1 is objected to because claim 1 recites "the elongated member". Applicant has amended the claims to properly refer to a "needle". Hence, Applicants respectfully request the Examiner withdraw the rejection above.

II. Claims Rejected Under 35 U.S.C. § 112

Claims 3 and 4 were rejected under 35 U.S.C. § 112 as being indefinite for depending on a cancelled claim. Claims 3 and 4 are amended to depend on currently pending claim 1. Applicant respectfully requests that the Examiner withdraw the rejection.

III. Claims Rejected Under 35 U.S.C. § 103

A.

Claims 1, 3, 5-9, 11, 12, 14-20 and 26 were rejected under 35 U.S.C. § 103 (a) as being unpatentable over in view of U.S. Patent No. 6,063,085 to Tay et al. ("*Tay*"), in view of U.S. Patent No. 6,539,792 to Lull, et al. ("*Lull*"). In order to establish a *prima facie* case of obviousness: (1) there must be some suggestion or motivation, either in the references themselves or in the knowledge generally available to one of ordinary skill in the art, to modify

the reference; (2) there must be a reasonable expectation of success; and (3) the references when combined must teach or suggest all of the claim limitations. MPEP 2142. Applicants respectfully submit that a *prima facie* case of obviousness has not been established.

More particularly, none of the cited references either singly or combined provide the suggestion or motivation to modify the references. The mere fact that the references can be combined or modified does not render the resultant combination obvious unless the prior art also suggests the desirability of the combination. MPEP 2143.01. Independent claim 1 is directed to a thermally conducted heating element coupled to the distal portion of the needle, wherein the heating element is coupled to balanced circuit which measures a first differential resistance between the heating element and a variable resistor in response to a first condition and second differential resistance in response to a second condition to indicate a change of conditions related to a distance of penetration of the heating element into a tissue. Independent claim 11 is directed to a needle coupled to a thermally conductive heating element at a portion of the needle adjacent to the distal end of the needle, wherein the heating element is coupled to a balanced circuit having two resistive circuit elements. According to the Application, a balanced circuit is capable of measuring heat dissipation characteristics of a tissue environment in which the heating element is disposed. Thus, independent claims 1 and 11 contemplate an apparatus for determining injection depth and/or tissue type at a distal end of a needle based on the heat dissipation characteristics of body tissue using a thermally conductive heating element: (1) coupled to a distal portion of the needle (claim 1), or (2) coupled to a portion of the needle adjacent to the distal end (claim 11). (App., p.2, Ins. 9-11)

In contrast, *Tay* discloses an apparatus for closing and sealing a puncture at a puncture site in a vessel located beneath the skin using radio frequency or other energy to cauterize the puncture. (col. 2, Ins. 45-47) *Lull* discloses a sensor that includes a first resistor, a second resistor, a first circuit, and a second circuit wherein the first and second resistors each has a resistance that varies in response to a change in a physical property. (Abstract) According to *Lull*, the sensor can be applied in semiconductor manufacturing processes and automotive applications. (col. 17, Ins. 1-5)

However, neither of the references teaches the heating element coupled to the distal portion, or coupled adjacent the distal end of the needle as required by claims 1 and 11. The Patent Office states that it would have been obvious to position the heating element on the distal

portion of the needle disclosed by *Tay* to avoid creating an additional unnecessary puncture. However, this position does not make sense as *Tay* does not require an additional puncture, but simply does not teach the heating element near the distal end of a needle.

In addition, by coupling the heating element to the distal portion of the needle (see Claim 1), or to a portion of the needle adjacent to the distal end (see Claim 11), embodiments described in the specification, for example, without limitation thereto, provide benefits of: (1) allowing accurate determination of an injection depth and/or tissue type to inject drugs into blood filled cavities without visually guiding a needle of an injection device or having some other indication of the needle location within a patients body (see page 1, lines 12-20; page 2, lines 8-19; and page 3, line 31- page 4, line 15); (2) such as to allow the heating element to be disposed distal to an injection opening to more accurately determine injection depth in cases where a larger signal/reading is obtained when the tip of the needle has entered tissue just distal to the desired injection depth (see page 6, lines 1-13 and additional Claims 27 and 28); (3) allow multiple heating elements to be mounted on the needle to select more accurate measurement between multiple penetration depths and tissue types based on a selection of heating elements to be operated (see page 9, lines 1-7; page 16, lines 32 through page 17, line 32 and FIG. 7; and new claims 20 and 29); and/or (4) allow for more accurate control of a depth of penetration of a needle into the wall of a coronary artery to a desired penetration depth (see page 15, line 15 through page 16, line 31 and FIG. 6). However, none of the cited references teach or enable such benefits.

Moreover, there is no suggestion in the cited references that it is desirable to combine a sensor which, according to *Lull*, can be used in semiconductor manufacturing processes and automotive applications with a vessel cauterizing medical device, as taught by *Tay*. The statement made by the Examiner that it would have been obvious to modify *Tay* in view of *Lull* "in order to compare variations in the resistance of the heating element" is merely a characteristic of the sensor described in *Lull* and is not a proper motivation to combine the cited references. (Office Action, p.4-5)

Moreover, the fact that a claimed invention is within the capabilities of one of ordinary skill in the art is not sufficient by itself to establish a *prima facie* case of obviousness without some objective reason to combine the teachings of the references. MPEP 2143.01. In response to Applicant's previous arguments that a proper motivation to combine was not set forth, the

Examiner states: "Tay et al. fails to disclose any specific circuitry to control the anemometer. As a result, one having ordinary skill in the art would look towards the prior art for a circuit to control an anemometer." (Office Action, p.6) The Examiner has provided no objective reason to combine *Tay* with *Lull*, but has merely made a generic statement that "one having ordinary skill in the art would look towards the prior art for a circuit to control an anemometer." The Examiner has not met his burden in providing a proper motivation to combine the cited references.

Furthermore, Applicant asserts that the Examiner has improperly combined the references because *Tay* teaches away from the claims. MPEP 2145(X)(D). A prior art reference must be considered in its entirety including portions that lead away from the claimed invention. MPEP 2141.02(VI). Independent claim 1 includes the limitation of "a needle having . . . a distal portion suitable for *insertion* into tissue . . . and a lumen extending from a proximal end to the distal opening and in communication with the distal opening to allow a substance to be delivered through the lumen and out of the opening." Independent claim 11 includes the limitation of "a needle having dimensions suitable for insertion into a body, and having a distal end capable of *puncturing* skin." Thus, the needle in Applicant's invention is either inserted into or punctures skin. By contrast, the cautery apparatus in *Tay* is designed to seal an already existing puncture wound in a vessel. (col. 5, Ins. 10-62) Representatively, *Tay* discloses that the "present invention effects the hemostatic closure of a percutaneous or other type of puncture, incision or opening in a body vessel." (col. 5, Ins. 45-57) Thus, *Tay* teaches away from independent claims 1 and 11 and therefore was improperly combined with *Lull*.

B.

Claims 4 and 13 were rejected under 35 U.S.C. 8 103(a) as being obvious over *Tay* in view of *Lull* in further view of U.S. Patent No. 3,740,604 to Zenick ("*Zenick*"). Dependent claim 4 depends from dependent claim 2 which depends from independent claim 1. Dependent claim 13 depends from independent claim 11. Therefore, claims 4 and 13 include at least each and every limitation set forth in independent claims 1 and 11. Thus, in view of Applicant's remarks set forth above with respect to independent claims 1 and 11, Applicant respectfully submits that dependent claims 4 and 13 are patentably allowable.

C.

Claims 10 and 18 were rejected under 35 U.S.C. 5 103(a) as being obvious over *Tay* in view of *Lull* in further view of U.S. Patent No. 5,873,835 to Hastings et al. ("*Hastings*").

Dependent claim 10 depends from independent claim 1. Dependent claim 18 depends from dependent claim 14 which depends from independent claim 11. Therefore, claims 10 and 18 include at least each and every limitation set forth in independent claims 1 and 11. Thus, in view of Applicant's remarks set forth above with respect to independent claims 1 and 11, Applicant respectfully submits that dependent claims 4 and 13 are patentably allowable.

CONCLUSION

In view of the foregoing, it is believed that all claims now pending, namely claims 1, 3-20 and 26, patentably define the subject invention over the prior art of record, and are in condition for allowance and such action is earnestly solicited at the earliest possible date. If the Examiner believes that a telephone conference would be useful in moving the application forward to allowance, the Examiner is encouraged to contact the undersigned at (310) 207 3800, x766.

Respectfully submitted,

BLAKELY, SOKOLOFF, TAYLOR & ZAFMAN LLP
